

Metrics for assessing adaptation, risk and resilience

Reinhard Mechler, IIASA

Oktober 26, 2018

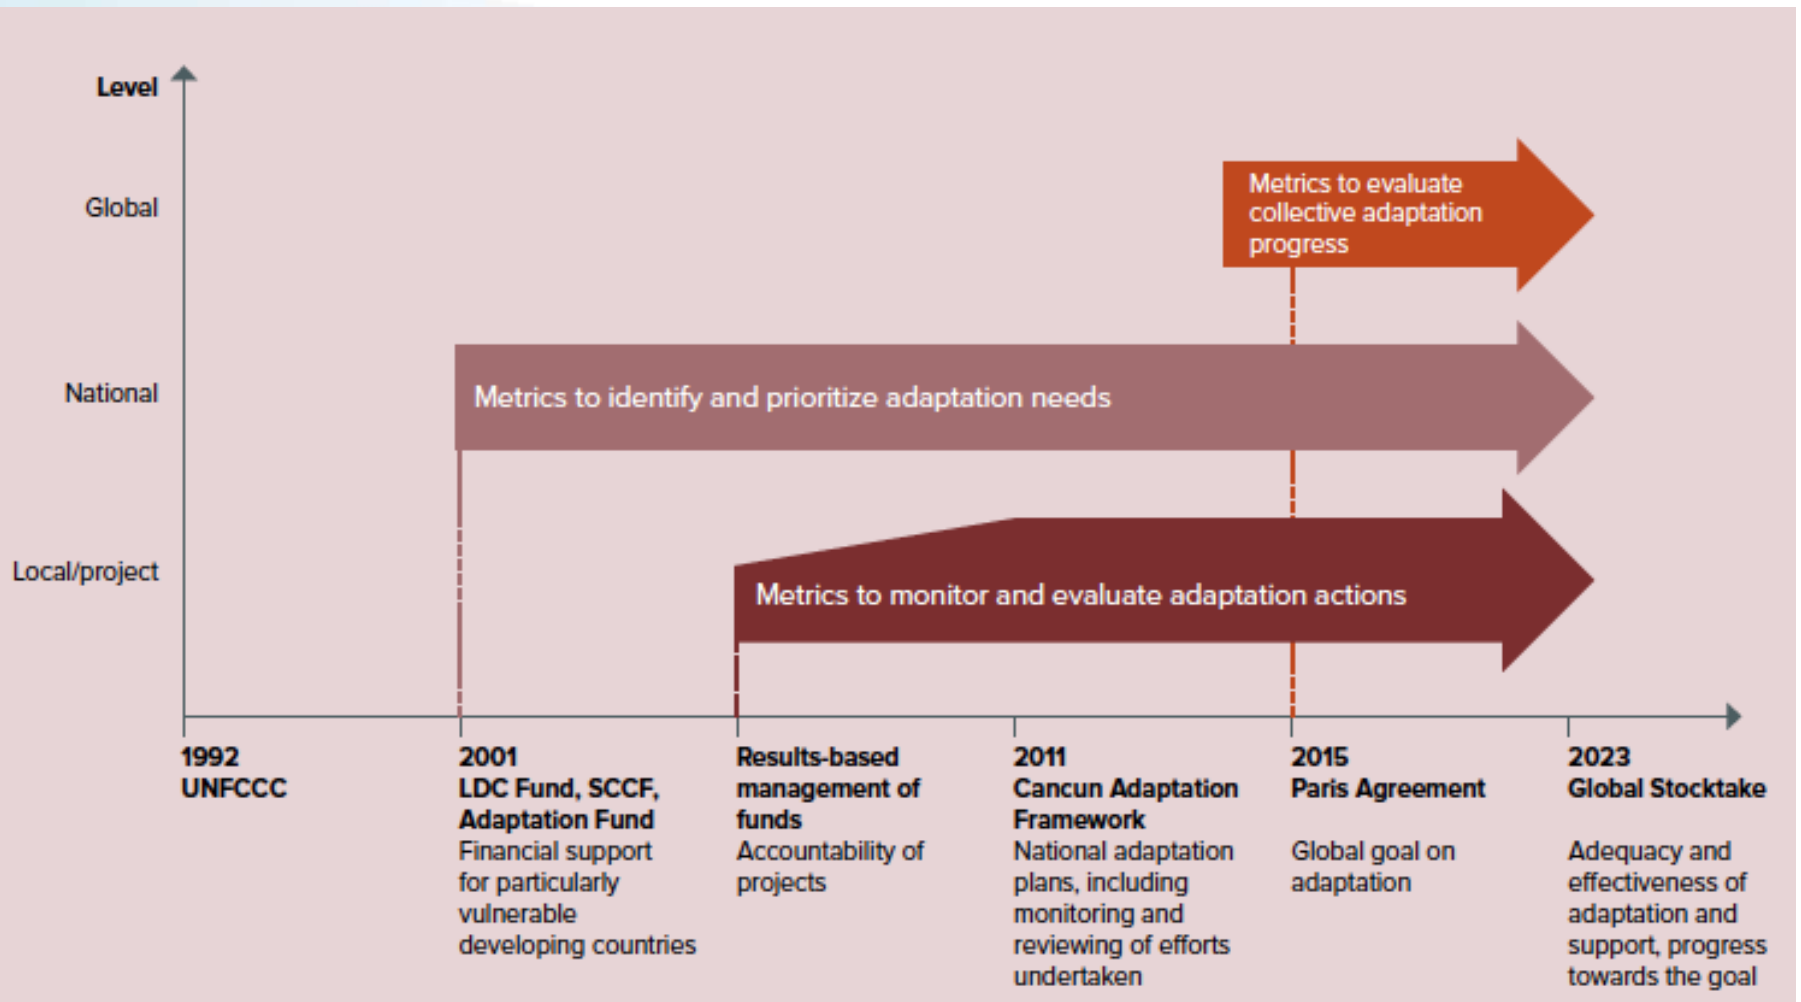

International Conference on
Adaptation Metrics for Agriculture, Water and Resilient Cities

Mohammed VI University, Benguerir, Morocco

Adaptation metrics: what to measure?

- **Identifying need for adaptation: Vulnerability**
Identify and compare state and needs: most vulnerable
- **Measuring and tracking inputs, output and process of implementing adaptive actions:**
Input: e.g., spending on flood protection,
Output: e.g., the number of early warning plans implemented,
Process: running an inclusive risk management process
- **Measuring the effectiveness of adaptation - monitoring and evaluation: outcome**
Measure progress and provide feedback on the effectiveness of actions, e.g. flood risk

Demand for adaptation metrics

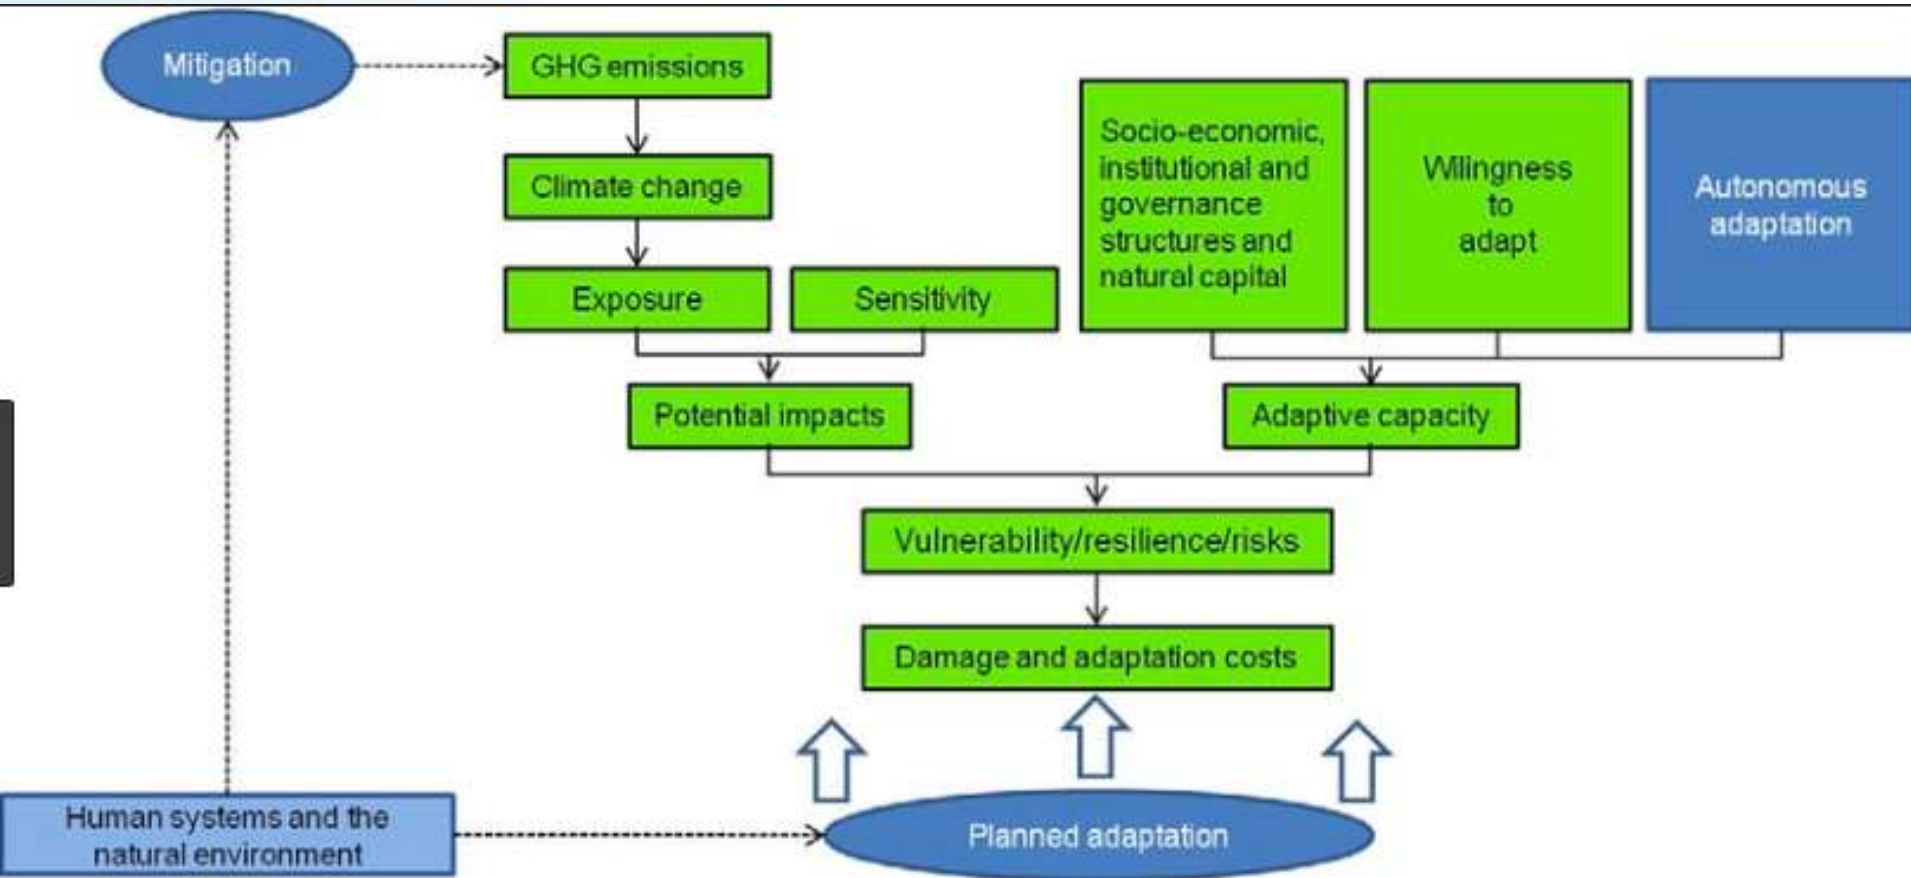

Uptake in NDCs

Table 2. Examples of quantitative targets and goals included in the adaptation component of the communicated intended nationally determined contributions (UNFCCC, 2016c p. 68).

Sector/area	National example
Water	<ul style="list-style-type: none"> • Ensure full access to drinking water by 2025 • Increase water storage capacity from 596 m³ to 3,997 m³ in 2015–2030 • Increase desalination capacity by 50% from 2015 by 2025
Agriculture	<ul style="list-style-type: none"> • Convert 1 million ha of grain fields into fruit plantations to protect against erosion • Increase the amount of irrigated land to 3.14 million ha • Reduce post-harvest crop losses to 1% through treatment and storage
Ecosystems and biodiversity	<ul style="list-style-type: none"> • Protect 20% of marine environments by 2020 • Regenerate 40% of degraded forests and rangelands • Establish 150,000 ha of protected marine areas
Forestry	<ul style="list-style-type: none"> • Increase forest coverage to 20% by 2025 • Maintain 27% forest coverage • Achieve 0% deforestation rate by 2030
Disaster risk reduction	<ul style="list-style-type: none"> • Ensure that all buildings are prepared for extreme events by 2030 • Reduce the number of the most vulnerable municipalities by at least 50% • Relocate 30,000 households
Energy	<ul style="list-style-type: none"> • Ensure that hydropower generation remains at the same level regardless of climate change impacts • Increase the proportion of renewable energy to 79–81% by 2030
Other	<ul style="list-style-type: none"> • Ensure that 100% of the national territory is covered by climate change adaptation plans by 2030 • Reduce moderate poverty to 13.4% by 2030 and eradicate extreme poverty by 2025

1. Assessing climate vulnerability

Assessing climate vulnerability for water resources

Table 2 Indicators used to represent *Global Impact Factors* for the CVI value for Mongolia

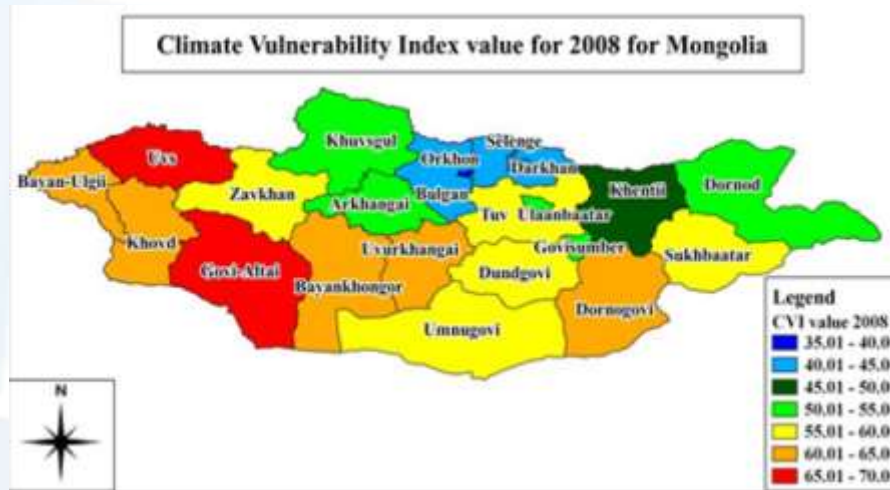

<i>Global Impact Factors (GIFs)</i>	Data used for each indicator	Source data
Geospatial variability (G)	<ul style="list-style-type: none"> Isolation from the capital city (food sources) Human population density Range in altitude (slope) 	<ul style="list-style-type: none"> Dist from capital, Mong Rd Atlas 2004 Statistical yearbook 2008 Topog Map NASA SRTM 90m DEM data
Resource quantification (R)	<ul style="list-style-type: none"> Ave annual precip (mm) * Total water res per capita (M³) * 	<ul style="list-style-type: none"> Statistical yearbook 2008 Water census 2007, MNET /HDR, 2011
Accessibility and property rights (A)	<ul style="list-style-type: none"> Useable water resource per capita (cubic metre) * Domestic water use (litre per day) * 	<ul style="list-style-type: none"> Water census 2007, MNET cited in Mongolia HDR, 2011 Stats yearbook 2008, Basandorj (2011)
Capacity of people and institutions (C)	<ul style="list-style-type: none"> Under 5 mortality rate (per 1000 live births) Tot sch children as % of school age cohort * GDP per capita (1000 togrogs) * 	<ul style="list-style-type: none"> The MDGs Implementation, 2009 National Statistical office, 2008 Statistical yearbook 2008
Utilisation and econ efficiency (U)	<ul style="list-style-type: none"> Econ return on ag water use (togrog) * Econ return on ind water use (togrog) * Econ return on mun water use (togrog) * 	<ul style="list-style-type: none"> Statistical yearbook 2008 Statistical yearbook 2008 Statistical yearbook 2008
Ecological integrity maintenance (E)	<ul style="list-style-type: none"> Forest area (hectare) * Pasture-damaged land (in percentages) Livestock density Road network (km) 	<ul style="list-style-type: none"> FAO (2007),Darkhan gov MNET, 09 Mong HDR, 2011 National Stats office, 2008 Mongolian Road Atlas, 2004

Note: Indicators marked with * must be inverted to reflect negative impacts. For example, high rainfall will reduce water vulnerability by increasing water resources and availability, but the high livestock density will increase vulnerability. This means the score for rainfall must be inverted to reflect its impact on the overall CVI score, since high CVI means high vulnerability.

Sullivan and Byambaa, 2013

Measuring needs Vulnerability assessment

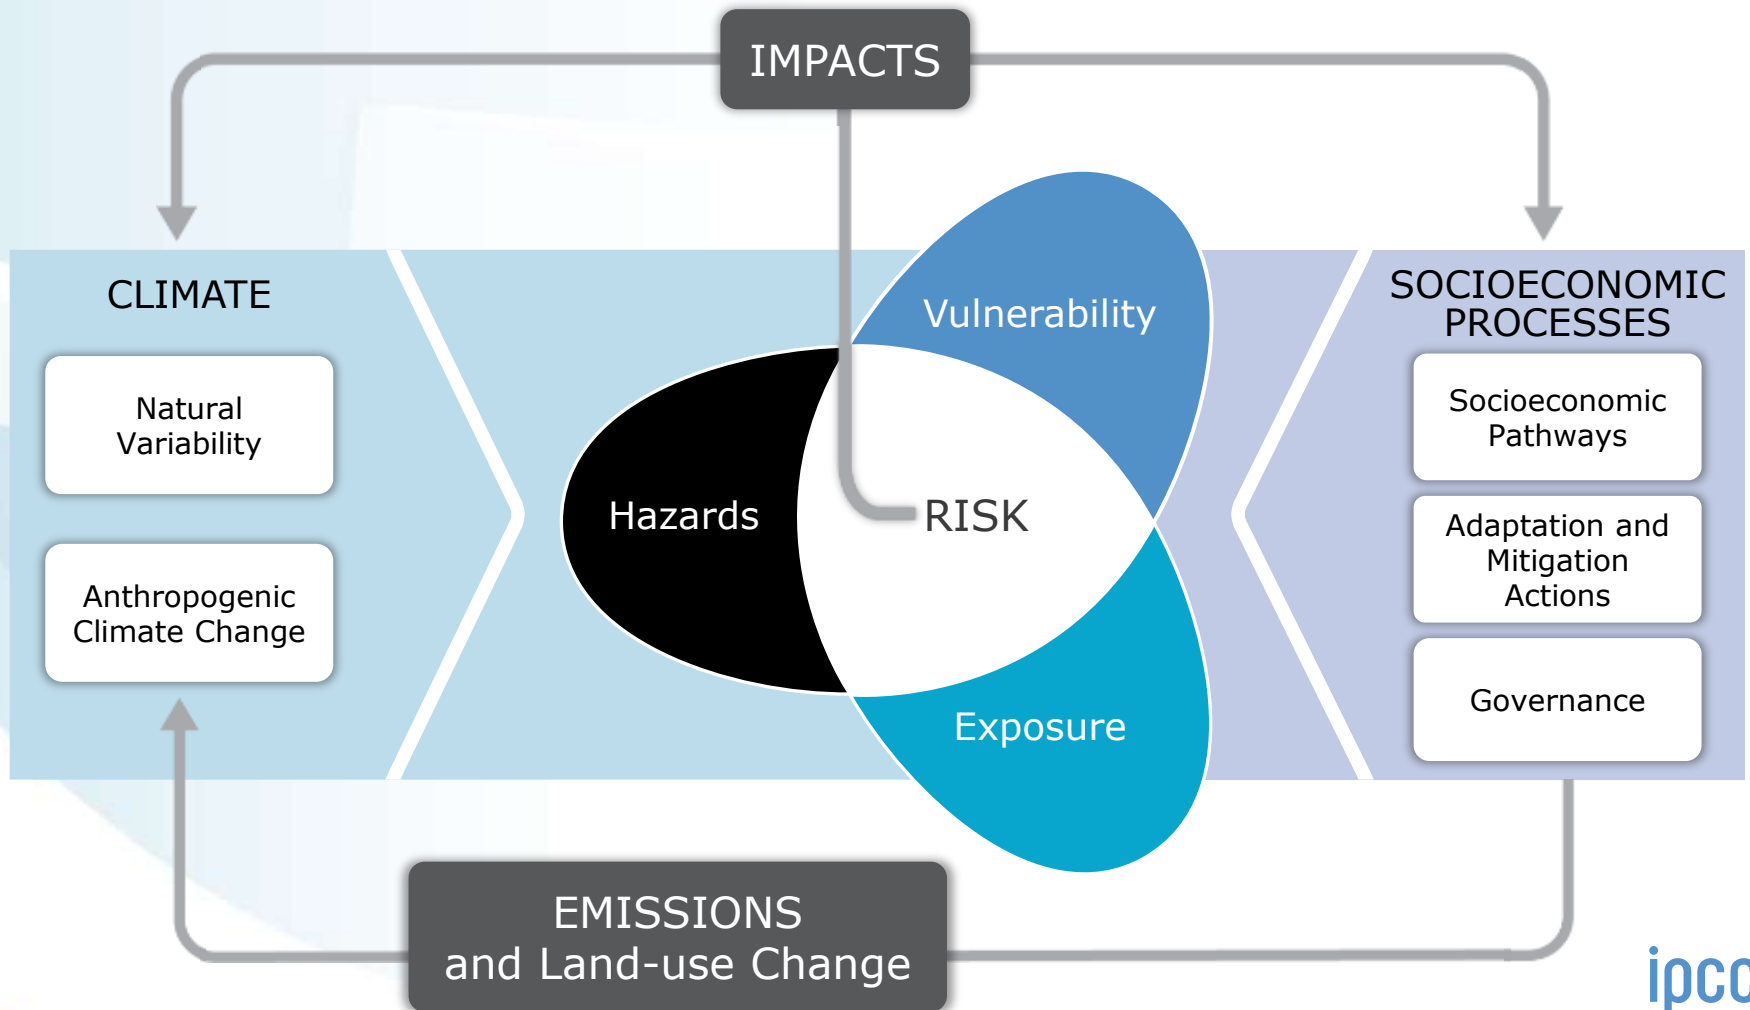

Sullivan and Byambaa, 2013

Status

- Focussed on need, rather than outcome and impact
- Construction of V Index not straightforward
- Comparisons across regions and countries difficult

DRM cycle: Country program compared to FRMT 70 communities

Status

- Strongly process-driven
- Quantitative-qualitative
- Focus on output rather than outcome

Final comments

- Water system (resources, flooding) strongly affected by climate change-directly and indirectly
- Adaptation occurring, but not well observed
- Measuring adaptation complex: work on metrics in flux
- Process-orientation important
- Climate risk management perspective promising combining qualitative and quantitative aspects
