The Ocean and Cryosphere in a Changing Climate

Symposium on Sea Level Rise in Southeast Asia
23 October 2019, Singapore
Ko Barrett and Gregory Flato
The world’s ocean and cryosphere have been ‘taking the heat’ from climate change for decades.

Consequences for nature and humanity are sweeping and severe.
High Mountains

Polar Regions

Ocean & Marine Life

Sea Level Rise
Greenland and Antarctic ice sheets are melting, and are now the major cause of accelerating global sea level rise, outpacing sea level rise caused by ocean thermal expansion.

During the 20th century, the global mean sea level rose by about 15cm. Sea level is currently rising more than twice as fast and continuing to accelerate.

Marine heatwaves have doubled in frequency since the 1980s and have become longer-lasting, more intense and more extensive, especially harming warm-water corals, kelp forests and the distribution of marine life.
Sea level changes for several reasons

- Terrestrial water storage, extraction of groundwater, building of reservoirs, changes in runoff, and seepage into aquifers
- Surface and deep ocean circulation changes, storm surges
- Subsidence in river delta region, land movements, and tectonic displacements
- Exchange of the water stored on land by glaciers and ice sheets with ocean water

As the ocean warms, the water expands.
We can observe and model these changes

Ocean warming

Melting mountain glaciers

Greenland/Antarctica ice sheet loss

IPCC WG-I 2013
Historical values

• Global mean sea-level rise, over the period 1902–2015, is 0.16 m (likely range 0.12–0.21 m). The rate of rise is unprecedented over the last century (high confidence).

• The sum of ice sheet and glacier contributions over the period 2006–2015 is the dominant source of sea-level rise, exceeding the thermal effect.

• The dominant cause of global mean sea level rise since 1970 is anthropogenic (human) forcing (high confidence).
Current Status

• Sea-level rise has accelerated (extremely likely) due to increased ice loss from the Greenland and Antarctic ice sheets (very high confidence).

• Mass loss from the Antarctic ice sheet over the period 2007–2016 tripled relative to 1997–2006. For Greenland, mass loss doubled over the same period (likely, medium confidence).

• Acceleration of ice flow and retreat in Antarctica, which has the potential to lead to sea-level rise of several metres within a few centuries, is observed in some locations of Antarctica (very high confidence).
Sea-level rise is not globally uniform and varies regionally. Regional differences, within ±30% of the global mean sea-level rise, result from land ice loss and variations in ocean warming and circulation.

(Based on climate model simulations)
Future Projections
(based on high and low emission scenarios)
Sea level extremes

Due to projected global mean sea-level rise, local sea-levels that historically occurred once per century are projected to become at least annual events at most locations during the 21st century.
Response options

- Various adaptation approaches are already being implemented, including:
  - protection
  - accommodation
  - ecosystem-based adaptation
  - coastal advance
  - managed relocation
- People with the highest exposure and vulnerability are often those with the lowest capacity to respond.
In the longer term, choices matter

Although ongoing sea-level rise is inevitable, ambitious mitigation will have a profound effect on the rate and ultimate magnitude of sea-level rise.
Knowledge for action

The IPCC Special Report on the Ocean and Cryosphere in a Changing Climate

• highlights the urgency of prioritizing timely, ambitious and coordinated action to address widespread and enduring changes in the ocean and cryosphere;

• empowers people, communities and governments to tackle the unprecedented transitions in all aspects of society;

• provides evidence of the benefits of combining scientific with local and indigenous knowledge.
The more decisively and earlier we act, the more able we will be to address unavoidable changes, manage risks, improve our lives and achieve sustainability for ecosystems and people around the world – today and in the future.
Our ocean and cryosphere –

They sustain us.
They are under pressure.
Their changes affect all our lives.

The time for action is now.
